Ideation Phase

Empathize & Discover

Date	25 September 2026
Team ID	SWTID-2026-3161
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool that helps teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Example: Script-Controlled ACL Project

Persona: HR System Administrator — responsible for making sure employee records are only seen by the people who should see them.

Think & Feel

- Worried that someone outside HR will open a confidential employee record
- Wants one rule that just works, instead of maintaining dozens of roles
- Anxious about failing the next compliance audit

Hear

- Compliance team says every sensitive field must be locked down
- Colleagues say a new role per department is unmanageable
- Manager asks why access wasn't restricted sooner

HR System Administrator

See

- A long list of static roles that only partly cover the real access rules
- Support tickets from employees who can see records they shouldn't
- Audit reports flagging over-exposed records

Say & Do

- Tells auditors that field-level access control is "in progress"
- Manually checks record ownership before responding to access complaints
- Asks the developer team to script a fix

Pain

- Creating a new role for every possible field value doesn't scale
- No easy way to prove, on demand, exactly who can see what
- Risk of a data-exposure incident

Gain

- One ACL rule that automatically checks the field value
- Confidence that only the right people see each record
- Less manual role administration
